### 1) Project title

Administrative drug flow usage for quality of care

### 2) Abstract (max 500 words)

In modern healthcare systems, the effective use of drug-related information is paramount to ensuring optimal patient care, safety and health care management. Administrative drug databases serve as foundational tools in this endeavor.

Administrative drug databases serve as invaluable tools for pharmacovigilance and quality improvement initiatives. By tracking medication usage patterns, adverse drug events, and medication discrepancies, healthcare organizations can identify trends, implement targeted interventions.

Secondly, administrative drug flow fosters interdisciplinary collaboration and communication among healthcare teams by facilitating real-time access to medication-related information. Through integrated electronic health records and pharmacy systems, decision makers can share vital medication data, coordinate care plans, and monitor patients' medication adherence and promoting continuity of care.

Furthermore, administrative drug flow plays a pivotal role in promoting cost-effective care management by optimizing medication utilization and reducing unnecessary expenditures. By analyzing medication utilization patterns, healthcare organizations can achieve substantial cost savings while ensuring the delivery of high-quality patient care.
